   EXPERIMENT
   Title
      ENCODE THE NUMBER
        You work in the message encoding department of a national security agency. Every message that is sent from or received in your office is encoded. You have
        an integer N, and each digit of N is squared and the squares are concatenated together to encode the original number. Your task is to find and return an
        integer value representing the encoded value of the number.
        input1: An integer value N representing the number to be encoded.
        Output:
        Return an integer value representing the encoded value of the number.
        Sample Input:
        Sample Output:
        13649
      Source Code:
        def encode_number(N):
             str_N = str(N)
             encoded_str = ""
             for digit in str_N:
                  squared_digit = int(digit) ** 2 # Square the digit
                  encoded_str += str(squared_digit)
             encoded_value = int(encoded_str)
             return encoded_value
        # Input reading
        N = int(input())
        result = encode_number(N)
        print(result)
```
